

Grapples for Forklifts

Grapples for Forklifts - On excavators, grapples could be used along with the crowing operation of the bucket cylinder. They could mount directly to the jib and could be used when processing and handling domestic and aggregate waste materials, timber and construction materials. The grapple's boxed design has added support bridging. This manufactured design offers the grapple with maximum support and strength by way of stopping the body from breaking and twisting during its operation.

The grapple along with all of its moving parts are made out of hardened steel. The rotating points are designed to ensure holding ability and supreme closing force. The individual operating it has the capacity to handle all sizes and varieties of materials using the jaws built-in at the end of the grapple with toes. This enables the jaws to be able to close through one another in a finger configuration for utmost handling capacity.
